

PERIPHERAL ARTERY DISEASE

Know the Facts. Know the Signs. Know Your Risk.

More than 18 million Americans suffer from Peripheral Artery Disease (PAD), a common medical condition where a build-up of plaque makes it difficult for blood to circulate through the arteries. PAD primarily affects the legs and feet, and is the leading cause of amputation in America. Knowing the facts, risk factors and symptoms associated with PAD, and getting proper treatment, could quite literally save your limb *and your life*.
